Understanding the Basics of EPDs

Fernanda M. Rezende, Caitlin L. Bainum, Joseph H. Walter, and Timothy W. Wilson

When selecting herd sires, producers often give consideration to color, soundness, structure, body condition, temperament, and genetics. Although expected progeny differences (EPDs) provide an excellent genetic description of a bull, many producers have difficulty understanding what EPDs mean and how to use them to drive the genetic advancement of the herd. The purpose of this publication is to provide basic concepts and practical examples to help beef producers and their advisors make informed selection decisions using EPD information.

WHAT DOES EXPECTED PROGENY DIFFERENCE (EPD) MEAN?

Expected progeny difference is the genetic description of a bull derived from data from its calves (progeny), its ancestors, and full and half siblings. The EPD represents the average genetic contribution of a specific bull to its progeny (i.e., what is transmitted from an individual to its progeny) and is expressed in the form of deviations from a reference population.

Half of the genetic material is passed on from parent to progeny through gametes (i.e., sperm and egg cells). Hence, only half of the independent effects of all genes affecting one trait are inherited. However, each offspring receives a random sample of its parent's genes, and some samples are better than others. EPDs are a representation of the average value of an individual's gametes for a specific trait. Therefore, EPDs can also be interpreted as the average value of an individual's contribution to its offspring's performance.

EPD values provide an estimate of how a bull's progeny are expected to perform relative to the progeny performance of a group of animals used as a point of reference in the genetic evaluation. This group of animals, formally called genetic base, has the average of their EPDs set as zero for all traits. Thus, all other EPDs are expressed as deviation from this average, explaining positive and negative EPD values that are reported. For instance, if a particular bull has an EPD of +1.6 lb for birth weight, and we are careful to randomly mate him to a cross-section of cows, not just those with especially heavy or light birth weight, we can expect the birth weight of its progeny to average 1.6 lb heavier than the average birth weight of the progeny from the genetic base. The genetic base can broadly be explained as a historic group of animals, such as all evaluated animals born at the onset of a 5- or 10-year period, used as a baseline.

Traits reported by a breed association may vary in number, with new traits added periodically. Typically, EPDs for growth traits such as birth weight (BW), weaning weight (WW), yearling weight (YW), and milk are often reported for beef cattle. Depending on the breed, additional traits related to carcass and ultrasound data may also have estimated EPDs.

EPDs indicate if a bull's progeny are expected to perform above or below compared to the progeny performance of the average bull in that breed. Breed averages can be expressed as the average of the EPDs of current sires (e.g., registered animals with at least one calf record in the herd book), main sires (e.g., sires with at least 35 yearling progeny weights), and non-parents (e.g., registered animals with no current progeny in the genetic evaluation). They are published by various breed associations at least semiannually.

Notably, EPDs are exceptional tools for comparing and ranking candidates for selection, because the difference between the EPDs of two animals is an estimate of the difference expected to be observed in the performance of their progeny.

HOW RELIABLE IS EPD?

The EPD values are always accompanied by an associated measure of reliability named accuracy. The accuracy value, expressed numerically between zero and one, is a

function of heritability and is impacted by the number of progeny and ancestral records available. Therefore, a specific bull has a more reliable EPD for birth weight than for calving ease because birth weight has higher heritability. Likewise, an individual with many progeny has a more reliable EPD for any given trait than an individual with few or no progeny. As the number of progeny reported to a breed association increases, the accuracy values will move closer to one.

The accuracy values can be viewed as a percentage. For example, a value of 0.39 could be seen as 39% accurate while a value of 0.98 could be viewed as 98% accurate. A low accuracy value indicates that a sire may be young, or that few calves have been reported to the breed association. As the EPD value is adjusted to more accurately define the genetic capabilities ("true" progeny difference) of the bull, the accuracy values increase. In other words, as additional calves are registered each year, EPD values for a bull are adjusted and the accuracy value increases, which reflects in lower expected change or potential deviation between the EPD and the "true" progeny difference.

Selection must be based on EPD values, and accuracy should be used as a guide to decide how intensively an individual animal should be used in the case of change (up or down) in its EPD value. If accuracy is low (e.g., young bull with few or no progeny), the producer assumes more risk that the animal's EPD is not a perfectly accurate prediction of genetic merit. Nevertheless, good reasons for using young bulls include their higher EPD values and lower cost of the bull or semen from the bull when compared to proven bulls. When selecting young bulls, producers can mitigate the risk by using a larger number of sires and setting a more stringent threshold (e.g., purchasing bulls or semen from bulls in the top 10% of available young bulls). This approach ensures higher accuracy of the EPDs of the group of young bulls than the accuracy of any one of these young bulls' EPDs. In addition, if one young bull is worse than the others, that young bull will sire a smaller fraction of calves. Fine-tuning the selection based on morphological and functional attributes of individuals selected by EPDs is still possible.

HOW DO I USE EXPECTED PROGENY DIFFERENCE?

Individual EPD values are negligible, but they are a powerful selection tool when used to compare an individual to its breed average EPDs and to rank candidates for selection. For example, if the EPDs listed in Table 1 for bull A were for an Angus bull, how would it compare to its breed average (Table 2) for birth weight (BW)? How would calves from bulls A, B, and C be expected to perform for birth weight?

Bull A has a BW EPD of +0.6 with 98% accuracy. When comparing the BW EPD of +0.6 to the breed average of +1.2, bull A would be expected to produce calves with lower birth weights than the average bull in the Angus breed ($0.6 - 1.2 = -0.6$, or 0.6 lb lower than the breed average). Compared to its counterparts B and C, bull A would be expected to produce the heaviest calves at birth. Indeed, bull A is expected to produce calves 1.4 lb and 3.4 lb heavier at birth than bull B [$0.6 - (-0.8) = 1.4$ lb heavier than bull B] and bull C [$0.6 - (-2.8) = 3.4$ lb heavier than bull C], respectively.

It is also important to consider the accuracy value, especially when selecting a sire that will breed heifers, since little or no information may be available on the female genetic contribution to the progeny. Bull A has the highest accuracy value for BW, 0.98 or 98%, so it can be anticipated that this bull's progeny will have birth weight differences close to the expected value.

If bull A was a Charolais rather than Angus, the results would differ from those in the first example. Using the same +0.6 BW EPD, which is higher than the Charolais breed average of -0.4, would result in calves from bull A weighing 1 lb more than the mean birth weight of calves from an average bull in the Charolais breed [$0.6 - (-0.4) = 1$ lb heavier than the breed average].

GENOMIC-ENHANCED EPDS

Proven bulls have more reliable EPDs than young genomic-tested bulls due to a higher number of available progeny records. However, the latter tend to have greater EPD values due to genetic progress over generations. Genomic-enhanced EPDs have become available to the beef industry and provide for unproven bulls the same amount of accuracy as if they had on average 20 progeny records, depending on the trait of interest. This is possible through the incorporation of genomic or DNA test information in the traditional genetic evaluation that uses pedigree and performance records. When evaluating young bulls with low accuracy values and no available genomic EPDs, an alternative is to include EPD information from their sire, dam, and grandsire in the decision-making process with an understanding that ancestral EPDs are not as accurate of a selection tool as genomic EPDs. If available, genomic EPDs provide a more accurate estimate of a young bull's genetic potential as a sire than ancestral EPDs and should be used for animal selection. It is also advised to use a group of young bulls, as the accuracy of the group EPD is greater than the accuracy of each individual bull's EPD. The accuracy of a group of young genomic-tested bulls is given by $Acc = 1 - (1 - \text{average acci})/n$, where acci is the average accuracy of individual bulls and n is the number of bulls in the group. For example, if the average accuracy of individual young bulls is 50%, the accuracy of EPD for a group of 3 bulls is about 83% [$1 - (1 - 0.5)/3 = 0.83$].

ACROSS-BREED EPD COMPARISONS

In many operations, producers opt for a crossbreeding program to take advantage of heterosis: performance advantages of the resulting crossbred calf crop compared to the average of the parental breeds. This can present a challenge when utilizing within-breed estimated EPDs for genetic merit comparison of bulls from different breeds because breed associations often use different national evaluation programs and differences exist in the genetic base across breeds. In crossbred operations, producers must be capable of comparing sires across breeds by adding appropriate adjustment factors to the EPD produced in the genetic evaluations for each breed. Across-breed EPD (AB-EPD) adjustment factors were developed to help producers select a sire for their goals with crossbred cattle.

AB-EPD factors are published yearly for 18 different breeds by the U.S. Meat Animal Research Center (MARC) in Clay Center, NE, and made available at www.beefimprovement.org. If the three bulls listed above (Table 1) are Angus, Brahman, and Charolais, respectively, the across-breed adjustment factors (Table 3) can be used to convert noncomparable within-breed EPDs to comparable across-breed EPDs (Table 4).

Remember that EPDs are not perfect when comparing bulls even within a breed; therefore, AB-EPDs are less accurate when comparing animals of different breeds. Many breed associations have adopted an alternative: the implementation of multi-breed genetic evaluations, which combines records from purebred and crossbred animals and accounts for direct and maternal heterosis and breed effects. Multi-breed genetic evaluations yield more accurate EPD predictions by virtue of data volume and permit direct comparison of EPDs from animals of different breed and breed composition. When EPDs from multi-breed evaluations are available, they are the most effective to commercial producers who are comparing and purchasing bulls of more than one breed to use in the crossbreeding system.

TAKE-HOME MESSAGE

In summary, EPDs are an excellent means to evaluate the expected genetic potential of a sire. Thus, EPDs are exceptional tools for comparing and ranking candidates for selection. Producers who use EPDs must consider that they are designed to predict expected progeny differences in performance and not actual bull performance. The adjustment factors may serve as a valuable tool for producers to more appropriately compare within-breed EPDs of bulls from different breeds for a crossbreeding program. Multi-breed EPDs are the most effective and accurate alternative for comparing the genetic merit of bulls from different breeds or breed combinations.

Table 1. Estimates of EPD and accuracy values.

Animal	BW acc	WW acc	YW acc	Milk acc
Bull A	+0.6 0.98	+60 0.97	+109 0.96	+27 0.95
Bull B	-0.8 0.83	-1 0.85	+1 0.73	+10 0.78
Bull C	-2.8 0.68	+56 0.63	+118 0.58	+38 0.31
BW: Birth weight. WW: Weaning weight. YW: Yearling weight. acc: Accuracy.				

Table 2. Breed average EPDs for Angus and Charolais.

Breed	BW	WW	YW	Milk
Angus	+1.2	+59	+105	+26
Charolais	-0.4	+57	+104	+23
BW: Birth weight. WW: Weaning weight. YW: Yearling weight.				

Table 3. MARC adjustment factors to estimate across-breed EPDs.

Breed	BW	WW	YW	Milk
Angus	0.0	0.0	0.0	0.0
Brahman	9.0	60.2	24.0	12.4
Charolais	6.4	5.5	-23.9	-1.8

Table 4. Example of using across-breed adjustment factors to convert noncomparable within-breed EPDs to comparable across-breed EPDs.

Animal	Breed		BW	WW	YW	Milk
Bull A	Angus	AB adj. factors ¹	0.0	0.0	0.0	0.0
		EPD ²	+0.6	+60	+109	+27

		EPD ²	-2.8	+56	+118	+38
		AB-EPD ³	+3.6	+61.5	+94.1	+36.2

¹ AB adj. factors are the MARC across-breed adjustment factors from Table 3.

² EPDs are the EPD values from within-breed genetic evaluation.

³ AB-EPDs are the across-breed EPDs after adjustment factors are applied to within-breed EPDs.

OCALA BULL SALE CONSIGNORS

"The Nation's Oldest Continuous Graded Bull Sale"

Bill Baird Angus – Lebanon, Tennessee • Lots 1, 2

Barnett Angus Ranches – Washington, Georgia • Lots 5-10

Barnett Angus has been producing registered Angus bulls since 1947. We are proud to be in our 77th year of operating a continuous herd. We are a forage-based operation specializing in raising 2-year-old bulls for the commercial rancher. We firmly understand how to develop bulls that are physically sound and backed by great genetics and pedigrees that hold up under pressure. Wilkes Barnett, owner: 701-401-9157. Chris Goldman, herdsman: 706-401-3120.

Bayvue Farms – Hermann, Missouri • Lots 86-89

Cattle have been my passion since I was a young kid, and that passion still drives our program today. We focus on breeding cattle with sound feet, structural integrity, longevity, fertility, and real-world performance. Years ago, we stepped away from chasing show-ring success and let the cream rise to the top through honest genetics and proven production. Our goal is to raise cattle that work, last, and create lasting value for commercial cattlemen and seedstock breeders alike.

Berry College – Mount Berry, Georgia • Lots 11, 12

Clegg Sodd Farm, Inc. – Bunnell, Florida • Lots 32-39

Cross S Cattle Company – Bunnell, Florida • Lots 21-31

Cross S Cattle Company is a registered Brangus cow-calf operation located in Bunnell, FL. Working with the natural adaptability to Florida conditions and maternal strength of Brangus cattle, Cross S genetics focus on fertility, yearling growth and structural soundness. Breeding to maximize intramuscular fat and ribeye area, Cross S carefully selects breeding pairs to produce top breed performers.

IJM Farm, Michael Clark – Ocala, Florida • Lots 14-16

Five Oaks Farm Red Angus – Sparta, Tennessee • Lots 18-20

With deep rooted red angus blood lines that run back generations in the Red Angus registry, Travis and Gail Giffey and their sons, Grady, Gavin, Gunnar, Gage and Grant, operate a herd with tremendous focus on maternal heritage. The quality of their herd has resulted in cattle being placed into herds from Florida to Washington State and Texas to Pennsylvania.

Greenview Farms Inc. – Screven, Georgia • Lots 48, 49, 58-61

On 3,500 acres in Southeast Georgia, Greenview Farms, Inc. is the oldest continuously active Polled Hereford breeder in the state and has been offering seedstock to commercial and purebred breeders since 1942. The herd consists of 400 mama cows, with bulls and heifers being developed for sale. We run between 800 and 1,000 head total. In 1981, Greenview started breeding half its herd to Brahman bulls, producing F1 Braford, which are in high demand in the Southeast. Please visit our website www.greenviewfarms.net • Jonny Harris, Owner

Little W Farm – Lebanon, Tennessee • Lots 74-79

Mike and Connie Watkins own and operate Little W Farm in Lebanon, TN along with their daughters Kellie and Scott Porter (son Clifton) and Kristie and Jarrod Buhler (son Brayson). Mike and Connie run a family farm with roots in the Charolais breed. They offer a wide range of bloodlines. Their farm produces bulls that have been purchased all across the United States, and females that are competitive in the show ring. What began as a 4-H beef cattle project has now turned into a family business providing quality Charolais cattle with meat, milk, and good disposition. Make plans to visit our annual sale at the farm on the first Saturday in April each year. Check out our website: littlwfarm.com • Mike & Connie Watkins

MO Brangus – Sorrento, Florida • Lots 40-47

We have been raising Brangus cattle since 1983. We stand behind the bulls in this sale. We pay close attention to muscle, fertility, soundness, sheath, testicular and disposition. These 2-year-olds are structurally sound with muscle and are very even tempered. They are sound, functional and perform in the heat and humidity of Florida. We have saved our best because we want you to come back next year and in the years to come. We believe in culling bulls that are not structurally sound. It is our desire at MO Brangus to offer bulls for sale that will make money for you and that you will be proud to own. After 40 years of developing better bulls, this is the best group we have ever had.

 **(352) 427-8886**

Mueller Charolais – Altenburg, Missouri • Lots 62-73

It's always a pleasure going to the Ocala Bull Sale. We started raising Charolais cattle in 1964. We have been performance testing since 1983. We work on calving ease, performance, and eye appeal along with soundness and disposition.

Outfit 8 – Hermann, Missouri • Lot 13

In 2016, we began expanding our herd by purchasing Angus cows with strong Jorgensen genetics from South Dakota. Because we sell many bulls in the south, we incorporated Brangus genetics into our Angus program to develop cattle better suited for southern conditions. The addition of Brangus genetics allowed us to produce Ultrablacks, which have become a very successful part of our program. Briggs El Presidente was an especially valuable addition, helping take our Ultrablack program to another level. Ranking in the top 2% of the breed for ribeye area, he added performance and competitiveness to our Ultrablack cattle. Our philosophy with both Angus and Ultrablacks is the same as with our Charolais program: let the cream rise to the top. We focus on producing performance bulls with good feet and legs that also calve easily, rather than placing primary emphasis on calving-ease genetics alone.

Sea Star Acres- Williston, Florida • Lots 3, 4

Triple B Charolais – Lebanon, Tennessee • Lots 80-85

Triple B Charolais is owned by Bill, Brenda, and JW Baird. We appreciate the opportunity to bring bulls to Ocala from Middle Tennessee. We at Triple B Charolais are overjoyed to be bringing bulls for our 20th year. We have strived to produce bulls that work in Florida and help make a profit for their owners. Again, this year we have purebred Charolais and percentage Charolais (Charolais x Angus). We hope to build on our relationships with past buyers and new buyers of our bulls. At Triple B, we use AI and then cover our cows with bulls that are known for growth and maternal values. If you are new to the sale, stop by and we would enjoy getting to meet with you and if you bought bulls from us before, please stop by and give us feedback on the calf crops so we can continue to improve. See ya in October!

White's Hereford Farms – Scotts Hill, Tennessee • Lots 50-57

White's Hereford Farms, Hereford cattle, Scotts Hill, TN, raises quality Hereford herds in Henderson County in West Tennessee near Jackson. With over 25 years of breeding experience, the farm is part of the American Hereford Association and follows well-established health screening protocols for genetic soundness and disease prevention. The family-run operation began in the 1990s and has focused on breeding cattle with gentle temperaments and feed efficiency. Animals graze on managed pastures, and calves are gently handled from birth to encourage calm behaviors. Living facilities include sheltered barns and open fields that promote natural behaviors while ensuring protection during colder months. Routine testing for bovine viral diarrhea and Johne's disease is part of their health program. This hands-on care and health focus supports steady weight gain and beef quality. White's Hereford Farms maintains detailed records and provides on-going guidance on herd management and feeding strategies.

Whispering Pines Angus Ranch – Bartow, Florida • Lot 17

Located in beautiful Bartow, Florida, Whispering Pines Angus Ranch is dedicated to raising quality registered Angus cattle with a focus on sound genetics, excellent structure, and dependable performance. We take pride in producing cattle that reflect the strength, quality, and tradition of the Angus breed while maintaining a commitment to responsible breeding and ranching practices.

OCALA BULL SALE TERMS & CONDITIONS

"The Nation's Oldest Continuous Graded Bull Sale"

1. All bulls must be accompanied by Official Certificate of Veterinary Inspection issued by accredited veterinarian showing cattle are in good health and have met the following health requirements:
 - a. Tuberculosis- Bulls may be entered in the sale without a tuberculin test provided they are identified on health certificate as originating in a tuberculosis free state. All other bulls must be negative to tuberculin within 30 days of the date of the sale. (Bulls moving to FL from other states should comply with Florida Chapter 5C-3, F.A.C.)
 - b. Brucellosis- Bulls may be entered in the sale without a brucellosis test provided they are identified on health certificates as originating in certified brucellosis free herds. All other bulls must be negative to brucellosis test within 30 days of date of sale.
 - c. PI – BVD and Trichomoniasis (State Law) – All bulls must be accompanied by a negative Persistently Infected Bovine Virus Diarrhea (P.I. BVD- test.
 - d. Vibriosis and Trichomoniasis – All bulls which have been exposed to females must be accompanied by negative vibriosis and trichomoniasis tests.
- c. All vehicles transporting bulls to the sale must be properly cleaned and disinfected.
2. Each sale lot will be sold separately to the highest bidder. The sale order will be determined the day before the sale.
3. Any changes from information in the catalog will be announced from the auction block and will take precedence.
4. The auctioneer selling will settle any dispute as to bids by declaring all bids off and reselling the animal(s) in question.
5. Each animal will be at the seller's risk until sold, but as soon as sold will be at the purchaser's risk.
6. Terms of sale are cash, and payment is due from purchaser upon termination of the sale. Purchased animals will not be delivered until settlement has been made and released by barn superintendent.
7. All persons who attend the sale do so at their own risk. This association (Marion County Cattlemen's Association); assumes no liability, legal, or otherwise, for the safety of the building or premises, or for the behavior of or future uselessness of the animals. This association acts only as an agent for the consignors and assumes no responsibility, legal, or otherwise, to the public in general or between buyer and seller.
8. Bulls will be graded by a committee composed of four outstanding cattlemen and a representative of the University of Florida.
9. All bulls are guaranteed breeders by the consignor. In addition, all bulls must pass breeding soundness examination by an accredited veterinarian within 30 days of the date of the sale, and a certificate showing acceptable breeding soundness shall accompany all bulls to the sale.
